

**ABSTRACT**

[0034] Telephone information stored in the wireless communication device is automatically updated when a dialed telephone number has changed. Upon receiving an error code in response to making a call, the cell phone automatically determines if the error code indicates that the dialed telephone number has changed to a new telephone number. If so, the cell phone automatically determines the new telephone number from the error code and automatically updates a phone book contained within the cell phone with the new telephone number.
